Freezing Fruits and Vegetables at Home

Cooperative Extension Service
The University of Georgia
College of Family and Consumer Sciences

Advantages of Freezing

- Many foods can be frozen.
- Good natural color, flavor and nutritive value can be retained.
- Texture usually better than for other methods of food preservation.
- But this is personal preference.
- Foods can be frozen in less time than they can be dried or canned.

Disadvantages of Freezing Foods

- Texture of some foods is undesirable because of changes due to the freezing process.
- Initial investment and cost of maintaining a freezer is high.
- Storage space is limited by how much the freezer will hold.
How Freezing Affects Food

Enzymes in Vegetables and Fruits

* To prevent color and flavor changes, as well as loss of some nutrients, enzymes should be controlled.
* Are slowed down but not destroyed during freezing.

(Enzymes are small proteins in foods that start or help with reactions, such as those that cause browning, off-flavors, mushiness, etc.)

How Freezing Affects Food

Enzymes in Vegetables

* Are destroyed by heat, called blanching, before packaging and freezing.

Enzymes in Fruits

* Usually controlled by ascorbic acid (also called vitamin C) or some other additives.
* Fruits are usually not blanched, but can be.
  * People like them raw and uncooked.

How Freezing Affects Food

Textural Changes

* The water in food freezes and expands.
* Ice crystals cause the cell walls of fruits and vegetables to rupture, making them softer when thawed.
* Some vegetables with very high water content do not freeze well: celery, lettuce, some tomatoes.

How Freezing Affects Food

Best Advice for Freezing

* Freeze foods quickly.
  * Set freezer temperature at -10°F at least 24 hours ahead of freezing large quantities of fresh food.
* Spread packages out around the freezer, until frozen, then stack.
* Hold at 0°F for best quality.
Packing Foods to be Frozen

- Food must be cool before freezing.
- Ice water bath after blanching.
- Pack in serving size quantities.
  - Usually up to 1 quart.
  - Especially when whole package must be thawed to get out what is needed.

Packing Foods to be Frozen

- Pack foods tightly –
  - Avoid trapped air (oxygen).
  - Not to waste space.
- However, most foods need headspace or room for some expansion at the top, except
  - uneven vegetables like broccoli and asparagus,
  - bony pieces of meat,
  - tray-packed foods,
  - and breads.

Packing Foods to be Frozen

- Press all air from bagged foods.
  - Except for headspace.
  - Seal non-zippered bags by twisting the loose top, and then folding the top of it down over itself (gooseneck). Secure with twist-tie, rubber band or string.
- Use tight lid on rigid containers.
  - Keep sealing edges clean and dry. Use freezer tape over seams of looser-fitting covers.
  - Trapped food or liquids in sealing area will freeze, expand, and loosen seal.

Labels

- Name of product
- Added ingredients
- Form of food - halves, whole, ground, etc.
- Packaging date
- Number of servings or amount
Freezing Guidelines

1. Freeze foods at 0°F or lower.
   - 24 hours in advance of freezing large quantities of food, set freezer at -10°F or lower.
2. Freeze foods immediately after prep.
3. Do not overload freezer with unfrozen food.
   - Freeze amount that will freeze in 24 hours (2 to 3 pounds of food per cubic foot).
4. Pack already frozen foods together so they do not thaw.

Freezing Fruits

- Frozen in many forms –
  - Whole, sliced, crushed, juiced.
- Best quality –
  - Optimum maturity and freshness.
  - Immature or overripe both produce lower quality when frozen.
- Wash and work with small amounts at a time to preserve best quality.

Freezing Guidelines, cont.

5. Place unfrozen foods in contact with surfaces and in coldest parts of freezer.
6. Leave space around packages so cold air can circulate.
7. When packages are frozen, organize freezer into types of food.
8. Arrange frozen foods so that the foods frozen longer can be used first.
9. Keep a frozen foods inventory up to date.
10. Check thermometer periodically.

Preventing Fruit Darkening

During Preparation (Peeling, slicing, etc.)

- 1 tsp (3000 mg) ascorbic acid to one gallon of cool water
- Commercial ascorbic acid mixture
- Heating the fruit
- The following do not work as well:
  - Citric acid solution
  - Lemon juice
  - Sugar syrup
  - Salt/vinegar solution
Preventing Discoloration During Freezing

* Ascorbic Acid
  * Most economical
  * Powdered or tablet form
  * 1/2 t. powdered ascorbic acid = 1500 mg
  * For tablets, use number needed for desired milligrams
    * (for example, 3 x 500 mg tablets = 1500 mg)
  * Tablets must be crushed well

Preventing Discoloration During Freezing

* Ascorbic Acid (con’t)
  * In sugar or dry packs, dissolve the powdered ascorbic acid in 3 T. in cold water and sprinkle over fruit.
    * In sugar packs, before adding sugar.
    * Usually ¼ to ½ tsp (750 to 1500 mg) per 3 T. water for each quart of fruit.
  * For crushed fruit, purees or juices, mix the powdered ascorbic acid with the prepared fruit.
    * Usually about ¼ tsp (750 mg) or less per qt. of fruit.

Preventing Discoloration During Freezing

* Ascorbic Acid
  * Use amount specified for each fruit.
  * In syrup or liquid packs - add powdered ascorbic acid to the covering liquid.
    * Usually ¼ tsp (1500 mg) per quart of syrup.

Preventing Discoloration During Freezing

* Ascorbic Acid Mixtures
  * "Fruit Fresh" and others.
  * These have some other added ingredients.
  * Follow package directions to obtain correct strength of ascorbic acid.
Preventing Discoloration During Freezing

- Citric Acid or Lemon Juice
  - Not as effective as ascorbic acid.
  - May mask flavors of fruits.

- Steaming
  - Best for fruits that will be cooked before use.
  - Follow directions in freezing publications for times.

Preparing Peaches in Syrup

Sweetened Packs for Fruit

- Syrup Pack
  - Better texture.
  - Not needed for safety.
  - Fruits should be covered with syrup.
  - Place crumpled water-resistant paper in top of container.

Sugar Pack
- Sliced soft fruits (strawberries, peaches, etc.) make their own syrup when mixed with the right proportion of sugar.
- Layer fruit and sugar in bowl or pan.
- Allow mixture to stand 15 minutes to make juice or “syrup” before packaging.
Unsweetened Packs for Fruit

* **Dry Pack**
  * Good for small whole fruits such as berries that don't need sugar.
  * Simply pack into containers and freeze.
  * Or may be frozen individually, in single layer, on a tray first.
  * “Tray pack” – next slide

Dry “Tray” Pack for Fruit

* Can remove only the amount needed at one time.
* Fruit pieces retain shapes.
* Fruit pieces do not “clump” as when packed directly into containers or with sugar syrup.

Dry Tray Pack for Fruit

* Fruit pieces may be frozen individually, in single layer, on a tray first.
* Freeze until firm then package in rigid container or bag.
* Will pour out of container easily when frozen.

Unsweetened Packs for Fruit

* **Pectin Syrup**
  * Good for strawberries and peaches.
  * Mix 1 package powdered pectin and 1 cup water. Bring to boil, boil 1 minute. Remove from heat, cool and add 1-3/4 cups more water.

* **Water or Unsweetened Juice Packs**
  * Texture will be mushier.
  * Color poorer.
  * Freezes harder, takes longer to thaw.
Packs for Purees or Juices

* Pack as is, with or without sugar.
* Add ascorbic acid if light-colored.

Sugar Substitutes

* May be used in the pectin syrup, juice or water packs.
* Or could be added just before serving.
* These do not help with color retention or texture, like sugar does.
* Use amounts on product labels or to taste.

Freezing Vegetables

* Select young, tender, high-quality vegetables.
* Sort for size and ripeness.
* Wash and drain before removing skins or shells.
* Wash small lots at a time, lifting out of water. DO NOT SOAK.
* Work in small quantities, preparing as directed.

Preventing Flavor and Color Changes in Vegetables

Blanching

* Primary method to destroy enzymes for vegetables.
* Will also soften hard veggies to make packaging easier.
* Will also remove some microorganisms.
* Under-blanching can be harmful; it will stimulate enzymes and not destroy them. Check required blanching times for each food.
How to Blanch Vegetables

Use specific directions.
Work in small quantities.

How to Blanch Vegetables

**Steam Blanching**
- Use kettle with tight lid and basket.
- 1” to 2” of boiling water in bottom of pan.
- Vegetable should be in a single layer in basket.
- Start timing when covered.
- Takes 1-1/2 times longer than water blanching. Check times, however, for each food.

How to Blanch Vegetables

**In Boiling Water**
- Use blancher with lid or a kettle with basket and lid.
- Have 1 gallon water per 1 lb. of vegetables.
- Place vegetables in blanching basket.
- Lower vegetable into vigorously boiling water. Put lid on. Water should hardly stop boiling or return to a boil within a minute.
- If water keeps boiling, begin timing immediately. Otherwise, wait for water to come back to a boil.
Reliable Food Preservation Resources

Always use a recipe tested for safety of the final product when canning! The USDA revised several home canning processes in 1994. Recipes published prior to 1994, should be checked against a current, reliable resource for safety. Not all recipes found on the web or in other publications are scientifically tested. Unsafe recipes and procedures may result in severe illness.

Freezing is one of the easiest, most convenient and least time-consuming ways to prepare foods at home. Freezing does not sterilize food; the extreme cold simply retards growth of microorganisms and slows down changes that affect quality or cause spoilage in food. Properly frozen fruits will retain much of their fresh flavor and nutritive value. Their texture, however, may be somewhat softer than that of fresh fruit.

Selecting Freezer Containers
Before preparing fruit for freezing, assemble the containers you will use. The selection of containers depends on the fruit being frozen, personal preference and the types that are readily available. Containers should be moisture-vapor resistant, durable, easy to seal and should not become brittle at low temperatures.

Containers suitable for freezing fruits include plastic freezer containers, flexible freezer bags or glass canning and freezing jars. If jars are used, be sure to use wide-mouth jars for fruits packed in liquid. Regular (narrow mouth) jars break too easily at the neck.

Some household containers are not recommended for freezing. The cardboard cartons that milk, ice cream or cottage cheese come in are not moisture-vapor resistant enough. Regular (not canning) jars break too easily at freezer temperatures.

Preparing the Fruit
Sort, wash and drain fruits carefully, discarding parts that are green or of poor quality. Do not allow fruit to soak in wash water or it will lose nutrients and flavor. Prepare fruits as they will be used–stemmed, pitted, peeled or sliced. Prepare enough fruit for only a few containers at a time, especially those fruits that darken rapidly.

Do not use galvanized equipment in direct contact with fruit. The acid in the fruit dissolves zinc, which can be harmful in large amounts. Also, be wary of using iron utensils or chipped enamelware, as metallic off-flavors can result.

Types of Packs
There are several ways to pack fruits for freezing: syrup pack, sugar pack, dry pack or unsweetened pack.

Most fruits have a better texture and flavor if packed in sugar or syrup. However, the sugar is not necessary to safely preserve the fruit. For those watching their sugar intake, it can be left out or an artificial sweetener can be substituted.

The type of pack will depend on the intended use. Fruits packed in syrup are generally best for uncooked dessert use; those packed in dry sugar or unsweetened are best for most cooking purposes, because there is less liquid in the product.
Syrup Pack – The proportion of sugar to water depends upon the sweetness of the fruit to be frozen. A 40-per-cent syrup is recommended for most fruits. Lighter syrups are desirable for mild-flavored fruits to prevent masking of flavors. Heavier syrups may be needed for very sour fruits. A small piece of crumpled, water-resistant paper can be used to hold the fruit down in the syrup, if necessary.

Sugar Pack – Sprinkle sugar over the fruit and mix gently until the juice is drawn out and the sugar dissolved. Soft sliced fruits such as peaches, strawberries, figs, deseeded grapes, plums and cherries will yield sufficient syrup for covering if the fruit is layered with sugar and allowed to stand for 15 minutes. Some small whole fruits may be coated with sugar and frozen.

Dry Pack – The dry pack is good for small whole fruits such as berries, that give a good quality product without sugar. Simply pack the fruit into a container, seal and freeze.

A tray pack is an alternative that may make the fruit easier to remove from the container. Simply spread a single layer of prepared fruit on shallow trays and freeze. When frozen, promptly package and return to the freezer. The fruit pieces remain loose and can be poured from the container and the package re-closed. Be sure to package the fruit as soon as it is frozen, to prevent freezer burn.

Other Unsweetened Packs – In addition to a dry pack, unsweetened fruit can be packaged in water, un-sweetened juice or pectin syrup.

Unsweetened packs generally yield a product that does not have the plump texture and good color of those packed with sugar. The fruits freeze harder and take longer to thaw. However, some fruits such as raspberries, blueberries, steamed apples, gooseberries, currants, cranberries, rhubarb and figs give a good quality product without sugar.

The pectin syrup is often used for fruits, such as strawberries or peaches, that retain their texture better than if frozen in water or juice.

Packs for Purées and Juices – Purées and juices can be packed as is. Sugar may be added, if desired.

Using Artificial Sweeteners
Sugar substitutes may be used in any of the unsweetened packs. Both saccharin and aspartame work well in frozen products or they can be added to the fruit just before serving.

Artificial sweeteners give a sweet flavor but do not furnish the beneficial effects of sugar, such as color protection and thickness of syrup.

Labels on the products give the equivalents to a standard amount of sugar. Use directions on the container to determine the amount of sweetener needed.

Preventing Discoloration
Some fruits such as peaches, apples, pears and apricots darken quickly when exposed to air and during freezing. They may also lose flavor when thawed. There are several ways to prevent darkening of fruit and flavor loss.

Ascorbic Acid (Vitamin C) – Ascorbic acid or vitamin C is effective in preventing discoloration in most fruits. Not only does it preserve natural color and flavor of fruits, but it adds nutritive value as well.

Ascorbic acid in powdered form is available at some drugstores or where freezing supplies are sold. Ascorbic acid tablets may be more readily available and less expensive, but are more difficult to dissolve. They do need to be finely crushed before use. Fillers in the tablets may make the syrup cloudy, but they are not harmful. One-half teaspoon powdered ascorbic acid=1500mg.

Follow the directions below for using ascorbic acid in the various types of packs. Use the amount specified in the directions for freezing each specific fruit.

In syrup or liquid packs – Add powdered or crushed ascorbic acid to cold syrup shortly before using. Stir it in gently so you do not stir in air. Keep syrup refrigerated until use.

---

**PECTIN SYRUP**

**RECIPE**

1 box powdered pectin
2 3/4 cups water

Combine pectin and 1 cup water in saucepan. Heat to boiling and boil 1 minute. Remove from heat and add remaining water. Cool. Makes about 3 cups of moderately thick syrup. Add more water if thinner syrup is desired.

For fruit packed in water, unsweetened juice, or pectin syrup, submerge fruit by using a small piece or crumpled water resistant material, as for syrup pack. Seal tightly.
In sugar or dry packs – Dissolve the ascorbic acid in two or three tablespoons of cold water and sprinkle dissolved ascorbic acid over fruit just before adding sugar.

In crushed fruits, fruit purées and fruit juices – Add ascorbic acid to prepared fruit and stir well.

Ascorbic Acid Mixtures – Ascorbic acid mixtures are special anti-darkening preparations, usually made of ascorbic acid mixed with sugar, or with sugar and citric acid. The important active ingredient in these mixtures is ascorbic acid. Follow the manufacturer’s directions for use. Do not confuse this with the ascorbic acid specified in the table, Directions for Freezing Fruits.

Citric Acid or Lemon Juice – Citric acid or lemon juice are sometimes used in place of ascorbic acid. Neither, however, is as effective as ascorbic acid. When used in large quantities, they often mask natural fruit flavors.

Steaming – Steaming works best for fruits that will be cooked before use. Steam the fruit just until hot according to the directions for each fruit.

* Approximate.
** In general, up to one-fourth of the sugar may be replaced by corn syrup or mild-flavored honey. A larger proportion of corn syrup may be used if a very bland, light colored type is selected.

To make the syrup, dissolve sugar in lukewarm water, mixing until solution is clear. Chill syrup before using. Use just enough cold syrup to cover the prepared fruit after it has been placed in the container (about 1/2 to 2/3 cup of syrup per pint). To keep the fruit under the syrup, place a small piece of crumpled parchment paper or other water-resistant wrapping material on top and press fruit down into the syrup before sealing the container.

**Packaging, Labeling and Storing**

Most foods require headspace between the packed food and closure. This allows for expansion of the food as it freezes.

Before closing freezer containers, make sure sealing edges are free of moisture and food particles. Seal the container and label plainly. Include name of food, date and type of pack.

Freeze packaged fruits as quickly as possible at 0°F or below. For quickest freezing, place packages against the refrigerated surfaces of the freezer. Freeze no more food at one time than will freeze within 24 hours—usually two to three pounds of fruit per cubic foot of freezer space. After fruit is frozen, rearrange the packages and store close together.

Most fruits maintain high quality for eight to twelve months at 0°F or below; citrus fruits and citrus juices, for four to six months. Unsweetened fruits lose quality faster than those packed in sugar or syrup. Longer storage will not make the food unfit for use, but may impair its quality. It is a good idea to post a list of the frozen foods with freezing dates near the freezer and check the packages off the list as they are removed.

# Directions for Freezing Fruits

NOTE: The following fruits can all be packed using one of the unsweetened packs. However, the texture of some will be different than when sugar is used.

<table>
<thead>
<tr>
<th>Fruit</th>
<th>Preparation</th>
<th>Type of Pack (Choose One)</th>
</tr>
</thead>
</table>
| Apples      | Wash, peel, core and slice crisp, firm fruit. Slice medium apples into twelfths, large ones into sixteenths. | • Syrup pack in a 40 percent syrup. If ascorbic acid is used, use 1/2 teaspoon per quart of syrup.  
• Sugar pack using 1/2 cup sugar per quart of fruit, after steaming or boiling for 1 1/2 to 2 minutes to prevent darkening. Cool fruit in cold water and drain before mixing fruit and sugar.  
• Dry pack using the instructions or sugar pack, but omitting the sugar. |
| Apricots    | Wash, halve and pit firm, ripe apricots. Peel and slice if desired. If apricots are not peeled, heat in boiling water for 1/2 minute to keep skins from toughening during freezing. Cool in cold water, drain. | • Syrup pack in 40 percent syrup. If ascorbic acid is used, use 3/4 teaspoon per quart of syrup.  
• Sugar pack using 1/2 cup sugar per quart of fruit. Mix until all sugar is dissolved. If ascorbic acid is used, use 1/4 teaspoon dissolved in 1/4 cup water. |
| Blackberries or Dewberries | Wash and sort fully ripe, firm berries. Discard any soft or defective berries. | • Syrup pack in 40 or 50 percent syrup.  
• Sugar pack using 3/4 cup sugar per quart of berries.  
• Use dry pack. |
| Blueberries or Huckleberries | Wash and sort fully ripe berries, removing leaves, stems and defective berries. | • Use dry pack. Do not wash the berries until just before serving.  
• Crush or purée the berries and then mix with 1 to 1 1/8 cups sugar per quart of crushed or puréed berries. |
| Cherries: sour | Wash, stem and pit bright red, tree-ripened cherries. | • Syrup pack in 60 to 65 percent syrup.  
• Sugar pack using 3/4 cups sugar per quart of fruit. Mix until sugar is dissolved. |
| Cherries: sweet | Wash, stem and pit bright, fully-ripened cherries of dark-colored varieties. | • Syrup pack in 40 percent syrup. If ascorbic acid is used, use 1/2 teaspoon per quart of syrup. |
| Citrus Fruits | Wash and peel firm tree-ripened fruit that is heavy for its size. Divide fruit into sections, removing membrane and seeds. | • Syrup pack in 40 percent syrup made from excess juice or water.  
• Juice-Squeeze juice from the fruit, being careful not to press any oil from the rind. Freeze as is or add 2 tablespoons sugar per quart of juice. |
| Cranberries | Wash and drain firm, deep-red berries with glossy skins. | • Use dry pack.  
• Syrup pack in 50 percent syrup. |
| Figs | Wash fully ripe fruit. Peel if desired. | • Syrup pack in 35 percent syrup. If ascorbic acid is used, use 3/4 teaspoon per quart of syrup, or use 1/2 cup lemon juice per quart of syrup.  
• Use dry pack. If ascorbic acid is used, use 3/4 teaspoon per 3 tablespoons of water. |
<table>
<thead>

</tbody>
</table>
Freezing is an excellent way to preserve fresh vegetables at home. Freezing does not sterilize food; the extreme cold simply retards growth of microorganisms and slows down changes that affect quality or cause spoilage in food.

The quality of frozen vegetables depends on the quality of the fresh products and how they are handled from the time they are picked until they are ready to eat. It is important, also, to start with high-quality vegetables because freezing will not improve the product’s quality.

**Selecting Freezer Containers**

Before preparing vegetables for freezing, assemble the containers you will use. The selection of containers depends on the vegetable being frozen, personal preference and the types that are readily available. Containers should be moisture-vapor resistant, durable, easy to seal and should not become brittle at low temperatures.

Containers suitable for freezing vegetables include plastic freezer containers, flexible freezer bags and their protective cardboard cartons, or glass canning jars. Foods packed in wide-mouth jars are easier to remove than those packed in narrow-mouth jars.

Some household containers are not recommended for freezing. The cardboard cartons that milk, ice cream or cottage cheese come in are not moisture-vapor resistant enough. Regular (not canning) jars break too easily at freezer temperatures.

**Preparing the Vegetables**

Use vegetables at peak flavor and texture for freezing. Whenever possible, harvest in the cool part of the morning and freeze within a few hours. Wash vegetables thoroughly in cold water, lifting them out of the water as grit settles to the bottom of the washing container. Sort according to size for blanching and packing.

** Blanching**

 Blanching (scalding vegetables in boiling water or steam for a short period of time) is a must for almost all vegetables to be frozen. Blanching slows or stops the action of enzymes that can cause loss of flavor, color and texture. Blanching cleanses the surface of dirt and organisms, brightens the color and helps retard loss of vitamins. Blanching also wilts or softens vegetables and makes them easier to pack.

 Blanching time is crucial and varies with the vegetable and its size. Underblanching stimulates the activity of enzymes and is worse than no blanching. Overblanching causes loss of flavor, color, vitamins and minerals. See the directions for freezing each vegetable for the correct blanching times.
**Water Blanching** – For home freezing, the most satisfactory way to heat all vegetables is in boiling water. Use a blancher with a blanching basket and cover, or fit a wire basket into a large kettle with a lid.

Use one gallon of water per pound of prepared vegetables. Put the vegetables in a blanching basket and lower into vigorously boiling water. Place a lid on the blancher and start counting blanching time as soon as the water returns to a boil. Keep heat high for the time given in the directions for the vegetables you are freezing.

**Steam Blanching** – Heating in steam is recommended for a few vegetables. For broccoli, pumpkin, sweet potatoes and winter squash, both steaming and boiling are satisfactory methods. Steam blanching takes about 1 1/2 times longer than water blanching.

To steam, use a kettle with a tight lid and a basket that holds the food at least three inches above the bottom of the kettle. Put an inch or two of water in the kettle and bring the water to a boil.

Put the vegetables in the basket in a single layer so steam reaches all parts quickly. Cover the kettle and keep heat high. Start counting steaming time as soon as the lid is on. Steam blanch for the time recommended for each vegetable.

**Microwave Blanching** – Microwave blanching is not recommended. Research has shown that some enzymes may not be inactivated. Flavors could be off and texture and color lost. If you choose to risk low quality vegetables by microwave blanching, work in small quantities, using the directions for your specific microwave oven. Microwave blanching has not been shown to save time or energy.

**Cooling**
As soon as blanching is complete, cool vegetables quickly and thoroughly to stop the cooking process. To cool, plunge the basket of vegetables immediately into a large quantity of cold water, 60°F or below. Change water frequently or use cold running water or iced water. If ice is used, have about one pound of ice for each pound of vegetables. Cooling vegetables should take the same amount of time as blanching. Drain vegetables thoroughly after cooling. Extra moisture can cause a loss of quality when vegetables are frozen.

**Types of Pack**
Two basic packing methods are recommended for frozen vegetables–dry pack and tray pack.

**Dry Pack** – Place the blanched and drained vegetables into meal-size freezer bags or containers. Pack tightly to cut down on the amount of air in the package. Leave 1/2-inch headspace at the top of rigid containers and close securely. For freezer bags, fill to within three inches of the top, twist and fold back top of bag; tie with a twist or rubber band about 1/2- to 3/4-inch from the food. This will allow space for the food to expand. Provision for headspace is not necessary for foods such as broccoli, asparagus and brussel sprouts that do not pack tightly in containers.

**Tray Pack** – Place chilled, well-drained vegetables in a single layer on shallow trays or pans. Place in freezer until firm, then remove and quickly fill bags or containers. Close and freeze immediately. Tray-packed foods do not freeze in a block, but remain loose, so the amount needed can be poured from the container and the package reclosed.

**Labeling and Storing**
Label packages with the name of the product and the freezing date. Freeze at once at 0° F or lower. Because speed in freezing is important for best quality, put no more unfrozen vegetables into the freezer at one time than will freeze in 24 hours–usually two to three pounds of vegetables per cubic foot of freezer space.

For quickest freezing, place packages against the refrigerated surface of the freezer. After vegetables are frozen, rearrange the packages and store close together. Most vegetables maintain high quality for 8 to 12 months at 0°F or lower. Longer storage will not make food unfit for use, but may impair quality.

It is a good idea to post a list of the frozen vegetables near the freezer and to check off packages as they are used. Remember, frozen vegetables should be cooked without thawing.
### Directions for Freezing Vegetables

<table>
<thead>
<tr>
<th>Vegetable</th>
<th>Preparation</th>
<th>Blanching Time (in boiling water unless otherwise stated)</th>
</tr>
</thead>
</table>
| **Asparagus**              | Wash thoroughly, sort by size. Cut in 2-inch lengths or leave in spears. Blanch, cool and drain. Package, seal and freeze. | Small stalks - 2 minutes  
Medium stalks - 3 minutes  
Large stalks - 4 minutes |
| **Beans: green or wax**    | Select young tender beans. Wash and remove ends. Leave whole, slice or cut into 1-inch to 2-inch lengths. Blanch, cool and drain. Package, seal and freeze. | 3 minutes |
| **Beans: lima, butter or pinto** | Select beans ready for table use with slightly rounded, bright green pods. Wash, shell and sort according to size. Blanch, cool and drain. Package, seal and freeze. | Small beans - 2 minutes  
Medium beans - 3 minutes  
Large beans - 4 minutes |
| **Beets**                  | Wash and sort according to size. Leave tap root; trim tops leaving 1/2-inch of stem. Cook in boiling water until tender. Cool, peel (removing stem and tap root) and cut into slices or cubes. Package, seal and freeze. | Cook:  
Small beets - 25-30 minutes  
Medium beets - 45-50 minutes |
| **Broccoli**               | Wash and trim. If insects are present soak 1/2 hour in solution of 4 teaspoons salt to 1 gallon of cold water. Split lengthwise into pieces no more than 1/2 inches across. Blanch, cool and drain. Package, seal and freeze. | In water - 3 minutes  
In steam - 5 minutes |
| **Brussels Sprouts**       | Select green, firm, compact heads. Make sure no insects are present. Trim, removing coarse outer leaves. Wash and sort. Blanch, cool and drain. Package, seal and freeze. | Small - 3 minutes  
Medium - 4 minutes  
Large - 5 minutes |
| **Cabbage** (for cooked dishes) | Select fresh, compact heads. Remove coarse outer leaves. Cut into medium to coarse shreds, or thin wedges, or separate head into leaves. Blanch, cool and drain. Package, seal and freeze. | 1 1/2 minutes |
| **Carrots**                | Select tender, mild-flavored carrots. Remove tops. Wash and peel. Leave small carrots whole. Cut others in 1/4-inch cubes, thin slices or lengthwise strips. Blanch, cool and drain. Package, seal and freeze. | Small, whole - 5 minutes  
Diced, sliced or strips - 2 minutes |
| **Cauliflower**            | Choose tender, firm, snow-white heads. Break into pieces about 1 inch across. Wash. If insects are present, soak 1/2 hour in solution of 4 teaspoons salt to 1 gallon of cold water. Drain. Blanch, cool and drain. Package, seal and freeze. | 3 minutes |

<tr>
<td>Corn: sweet</td>
<td>Select ears with plump kernels and thin sweet milk. Husk ears, remove silk and wash.</td>
<td>—— ——</td>
</tr>
<tr>
<td>whole kernel and creamed</td>
<td>Blanch, cool and drain. For whole kernel corn, cut corn off cob about 2/3 the depth of kernels. For cream style corn, cut at 1/2 the depth of kernels and scrape cob with back of knife to remove juice. Package, seal and freeze.</td>
<td>4 minutes</td>
</tr>
<tr>
<td>on the cob</td>
<td>Sort ears according to size. Small ears-1 1/4 inches or less in diameter. Medium ears-1 1/4 to 1 1/2 inches in diameter. Large ears-over 1 1/2 inches in diameter. Blanch, cool completely and drain. Package, seal and freeze.</td>
<td>Small ears - 7 minutes Medium ears - 9 minutes Large ears - 11 minutes</td>
</tr>
<tr>
<td>Eggplant</td>
<td>Wash, peel and slice 1/3 inch thick. Blanch in 1 gallon of water containing 4 1/2 teaspoons citric acid or 1/2 cup lemon juice. Cool and drain. Package, seal and freeze. For Frying-Package the drained slices with freezer wrap between slices. Seal and freeze.</td>
<td>4 minutes</td>
</tr>
<tr>
<td>Greens: beet greens, collards, chard, kale, mustard greens, spinach or turnip greens</td>
<td>Select tender leaves. Wash and remove stems. Blanch, cool and drain. Package, seal and freeze.</td>
<td>Collards - 3 minutes Other greens - 2 minutes</td>
</tr>
<tr>
<td>Mushrooms</td>
<td>Choose mushrooms free of spots. Sort by size; wash and trim ends. For better color, soak 5 minutes in a solution of 1 pint water and 1 teaspoon lemon or 1 1/2 teaspoons citric acid. Blanch, cool and drain. Optional Method-Sauté in butter or margarine until tender. Package, seal and freeze. In steam - 5 minutes Buttons or quarters - 3 1/2 minutes Slices - 3 minutes</td>
<td></td>
</tr>
<tr>
<td>Okra</td>
<td>Wash pods and separate into small pods (4 inches or less) and large pods. Remove the stems at the end of the seed cells, being careful not to expose the seed cells. Blanch, cool, drain. Leave whole or slice crosswise. Package, seal and freeze. For Frying-Slice blanched pods crosswise and dredge with flour or meal. Spread in a single layer on a shallow pan. Freeze just until firm. Package, seal and freeze.</td>
<td>Small pods - 3 minutes Large pods - 4 minutes</td>
