Like beautiful flowers, butterflies are gems when you find them flying, feeding, or basking in your backyard. They come in a range of sizes and colors and, depending upon the species, show up at different times of year—even in the winter.

To create a landscape that is inviting for butterflies you should consider their life stories. They begin as eggs, hatch into caterpillars that eat plants, spend time as a chrysalis, and, eventually, transform into winged adults that flit around looking for food, mates, and places to lay new eggs. During each of these stages butterflies have very different needs. The more of these needs you can supply, the greater the chance that your backyard will become a home for butterflies.

This fact sheet will help you provide the nectar flowers and caterpillar hostplants that these beautiful creatures need. It also contains suggestions on what else you can do to make the landscape around us—from small urban backyards to large natural areas—better for butterflies.

For more information, visit our web site, www.xerces.org, where you will find other fact sheets and more detailed guidelines on how to enhance habitat for pollinators. You’ll also find information about the Pollinator Conservation Handbook and Butterfly Gardening. Creating Summer Magic in Your Garden.
Caterpillar Food: Hostplants

The caterpillars of each species of butterfly have their own, limited menu of plants upon which it will dine. Female butterflies lay their eggs on or near these plants and will be attracted to your backyard if you supply their hostplants. To start with, grow hostplants for the more common butterflies you already see flying through your property and then branch out as you learn more. The list below includes native and non-native hostplants to consider planting in your garden.

Aspen, poplar (Populus) | Rose (Rosa) | mourning cloak
Bleeding heart (Dicentra) | Parnassians | Sagebrush (Artemisia) | swallowtails, painted lady
Clover (Trifolium) | sulphurs, blues | Snowberry (Symphoricarpos) | checkerspots
Globemallow (Sphaeralcea) | painted ladies, skippers | Spirea (Spirea) | many species
Grasses and sedges | skippers | Thistle (Cirsium) | painted ladies, crescents
Lupines (Lupinus) | blues | Violets (Viola) | fritillaries
Milk vetch (Astragalus) | blues, hairstreaks | Vetch (Vicia) | sulphurs, blues
Milkweed (Asclepias) | monarch | Wild lilac (Ceanothus) | hairstreaks, duskywings
Oak (Quercus) | hairstreaks, duskywings | Willow (Salix) | many species
Penstemon (Penstemon) | checkerspots, buckeye | Yellowrocket (Barbarea) | orange tips, whites

Adult Food: Nectar, Fruit, and Sap

Adult butterflies need sugar to fuel their search for mates and egg-laying sites. The main source of sugar is nectar from flowers. However, some butterflies, such as the mourning cloak, also get sugars from rotten fruit or the sap leaking from wounded trees. By providing flowering plants or plates of rotting fruit (like peaches, melons, or bananas) many of these beautiful insects will be attracted to your yard. Here is a selection of plants to consider growing in your garden.

Aster (Aster) | Milkweed (Asclepias)
Bee balm (Monarda) | Penstemon (Penstemon)
Beggarticks (Bidens) | Pincushion flower (Scabiosa)
Black-eyed Susan (Rudbeckia) | Purple coneflower (Echinacea)
Daisies (Chrysanthemum) | Sagebrush (Artemisia)
Elderberry (Sambucus) | Spirea (Spirea)
Goldenrod (Solidago) | Stonecrop (Sedum)
Joe-pye weed (Eupatorium) | Sunflowers (Helianthus)
Lavender (Lavandula) | Thistle (Cirsium)
Blazing-star (Liatris) | Yarrow (Achillea)

Hiding Places for Pupae and Other Useful Things

Pupation sites. The transformation from caterpillar to adult, the phase called pupation, is done within the protection of a chrysalis. Before building a chrysalis, however, a caterpillar wanders in search of a safe site. Depending upon the species, this haven could be a bush, tall grass, or piles of leaves or sticks. If you leave these features in your yard, you will encourage butterflies to stay around and drink the nectar you provide.

Overwintering sites. Depending upon the species, butterflies may overwinter (hibernate) as eggs, larvae, pupae, or even adults. You might find them on plants around the garden, under leaf litter, under loose bark, or in piles of logs and other debris. To help these hibernators, a little untidiness goes a long way. Two or three weeks before the severe cold of winter sets in, clean up only the leaves and garden debris that you must and pile up some logs or leaves around the edge of your yard.

Do not use insecticides in your garden. Finally, don't use pesticides in your garden. Alternative methods for controlling specific garden pests without using chemicals are available, but even these should be used with caution and keeping in mind the various life stages of butterflies.
